

Angular Testing

... but faster

Sections in this chapter:

1. Welcome
2. Why this talk?
3. Identifying what to test
4. Shallow rendering
5. Getting simpler
6. Getting faster

1-1. Welcome

Stephen Lau

1-1-1

Background in driver and graphics programming for the mobile industry.

Have spent the last few years working at Edument.

Lots of travel to China as well as teaching and consulting in Sweden and Germany.

1-1-2

1-1-3

1-2. Why this talk?

Why This talk

1-2-1

- Currently consulting on an Angular project
 - Testing needed to be improved
 - Unit testing took > 3 min
- Difficult to find "good" examples

Lets look for some good tests!

1-2-2

1-2-3

25 Amazing Angular Open Source Projects for the Past Year (v.2018)

For the past year, we've compared nearly 2,500 Angular open source projects to pick Top 25 (1% chance).

- *angular-realworld-example-app*
- *yatrum* - Travel guides (Ng 4.0.0)
- *echoes-player* - Media player for YouTube (Ng +6)
- *Angular.io*

1-2-4

1-2-5

1-2-6

1-2-7

```

stephen@ubuntu-vm:~/code/ng-test-talk/yatrum$ npm test
> Yatrum@1.0.0 test /home/stephen/code/ng-test-talk/yatrum
> ng test

Karma

1-3. Identifying what to test

Today we'll focus on:

1-3-1

- Component unit tests

We'll leave these alone:

1-3-2

- Service unit tests
- Integration tests
- E2E tests
- Manual testing

1-3-3

```
it('should instantiate ok', () => {
  expect(instance).to.exist;
});
```

A simpler example:

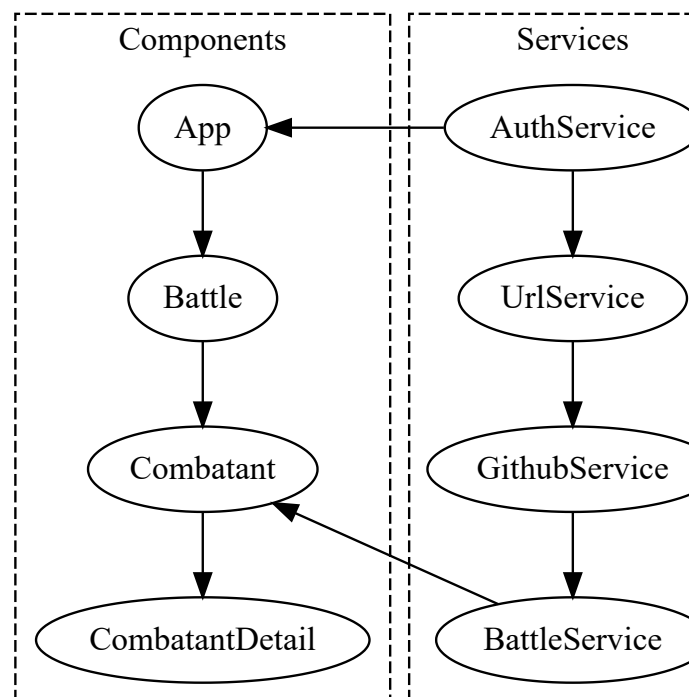

1-3-4

<http://githubbattle.netlify.com/>

1-3-5

```
return forkJoin(user$, repo$).pipe(map( ([user,list]) => {
  const cheat = user.login === 'toshi38';
  if(cheat) {
    console.log("This user is Stephen! Entering cheating mode!")
  }
});
```

```
<App>
  <Battle>
    <Combatant>
      <CombatantDetail>
    </Combatant>
  </Battle>
</App>
```

Components are our units!

1-3-7

Test the API

1-3-8

Avoid Fingerprinting

Battle component

1-3-9

Our current list

1-3-10

- Uses child components correctly
 - **Inputs []**
 - **Outputs ()**
 - **In/Out [()]**

Combatant component

1-3-11

New Additions:

1-3-12

- Component API
 - **Output @Output**
- Dependencies
 - **Found in constructor()**
- Template Logic
 - **Conditional rendering...** etc

Our Testing List

1-3-13

Child Components:

- Inputs []
- Outputs ()
- In/Out [()]
- @ViewChild
- local variable #

Template Logic

Dependencies:

- Check constructor()

Inputs/Outputs:

- @Input()
- @Output()

How to test:

1-3-14

[A.io - Component interaction](#)

[A.io - Testing](#)

1-4. Shallow rendering

```

<App>
  <Battle>
    <Combatant>
      <CombatantDetail>
    </Combatant>
  </Battle>
</App>

```

Battle Component Spec

1-4-2

```

@Component({
  selector: 'combatant',
  template: ''
})
class FakeCombatant {
  @Output() stars = new EventEmitter<number>()
}

const testModuleConfig = {
  imports: [CommonModule],
  declarations: [BattleComponent, FakeCombatant]
}

```

Emitting Output

1-4-3

```

//Find
let combatant1: FakeCombatant = debugElement
    .query(By.css('combatant'))
    .componentInstance;

combatant1.stars.emit(456);

```

No Errors

```
const testModuleConfig = {
  imports: [CommonModule],
  declarations: [AppComponent],
  schemas: [NO_ERRORS_SCHEMA],
  providers: [{provide: AuthService, useValue: fakeAuthService}]
}

describe('When logged in', () => {
  it('should render a battle component', () => {
    expect(nativeElement.querySelector('battle')).to.exist;
  });
})
```

ng-mocks

ng-mocks
7.1.1 • Public • Published 7 days ago

Readme 0 Dependencies 2 Dependents 23 Versions

build passing npm package 7.1.1

ngMocks

Helper function for creating angular mocks for test.

Why use this?

install

```
> npm i ng-mocks
```

± weekly downloads

747

version	license
7.1.1	MIT

ng-mocks Battle Component Spec

```
import { MockComponent, MockedComponent } from 'ng-mocks';

const testModuleConfig = {
  imports: [CommonModule],
  declarations: [BattleComponent, MockComponent(CombatantComponent)]
}

//Find
let combatant1: MockedComponent<CombatantComponent> = debugElement
  .query(By.css('combatant'))
  .componentInstance;

combatant1.stars.emit(456);
```

Mocking Services

1-4-7

```
const fakeBattleServiceObservable = {
  subscribe: sinon.stub()
};

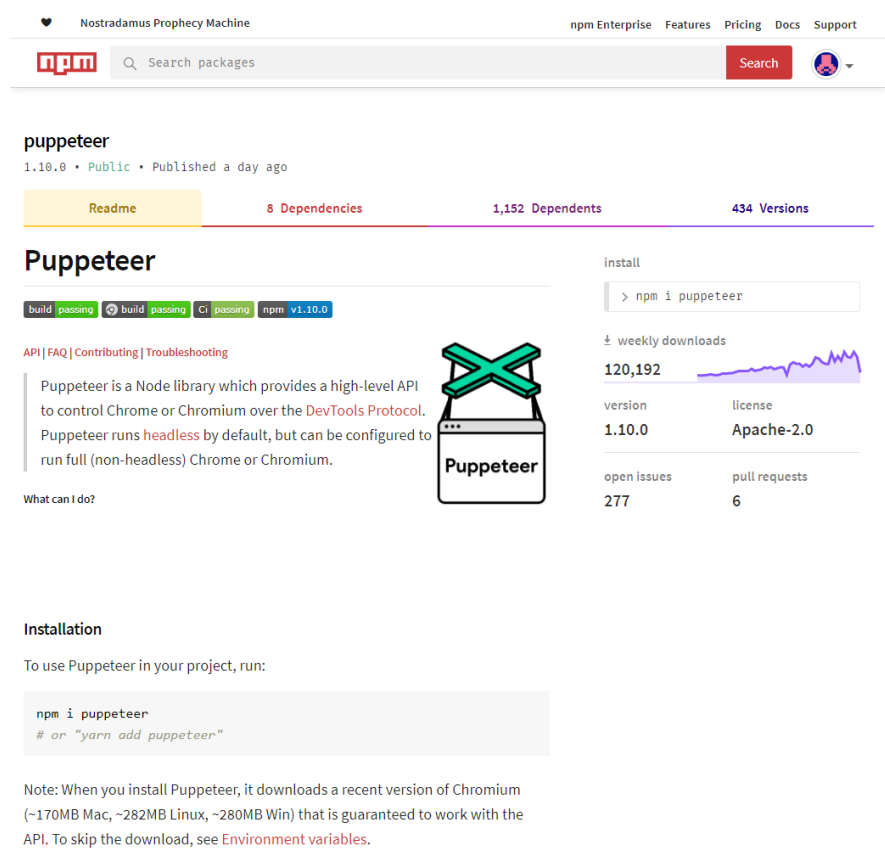

const fakeBattleService = {
  battleInfoForUser: sinon.stub().returns(fakeBattleServiceObservable)
};

const testModuleConfig = {
  imports: [FormsModule, CommonModule],
  declarations: [
    CombatantComponent, MockComponent(CombatantDetailComponent)
  ],
  providers: [{provide: BattleService, useValue: fakeBattleService}]
}
```

1-5. Getting simpler

Karma has a **browser** dependency.

1-5-1

The screenshot shows the npm package page for puppeteer. At the top, there's a navigation bar with links to Enterprise, Features, Pricing, Docs, and Support. Below the search bar, the package name 'puppeteer' is displayed along with its version '1.10.0', which is public and published a day ago. It has 8 dependencies, 1,152 dependents, and 434 versions. The main section is titled 'Puppeteer' and includes a description: 'Puppeteer is a Node library which provides a high-level API to control Chrome or Chromium over the DevTools Protocol. Puppeteer runs headless by default, but can be configured to run full (non-headless) Chrome or Chromium.' There's also a 'What can I do?' section. To the right, there's an 'install' section with the command 'npm i puppeteer', a graph showing 120,192 weekly downloads, and a table with version '1.10.0' and license 'Apache-2.0'. Below the main description, there's an 'Installation' section with the command 'npm i puppeteer' and a note about downloading Chromium.

1-5-4

Demo

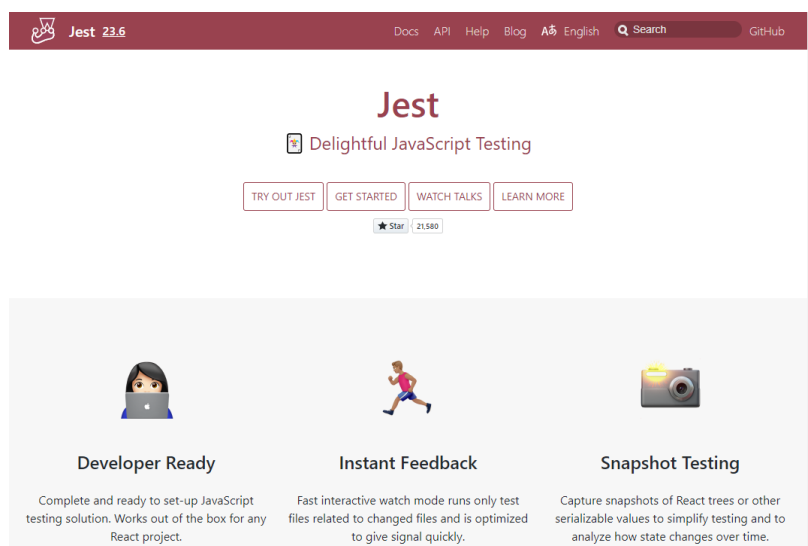

1-5-5

Puppeteer

1-6. Getting faster

jestjs.io

1-6-1

Install Jest

1-6-2

```
yarn add --dev jest jest-preset-angular @types/jest
```

jest.config.js

1-6-3

```
module.exports = {
  preset: "jest-preset-angular",
  roots: ['src'],
  setupTestFrameworkScriptFile: "<rootDir>/src/setupJest.ts",
  moduleNameMapper: {
    'testing/(.*)': '<rootDir>/src/testing/$1'
  }
};
```

setupJest.ts

1-6-4

```
import 'jest-preset-angular';
import './jestGlobalMocks';
```

jestGlobalMocks.ts

1-6-5

```
global['CSS'] = null;

const mock = () => {
  //...
};

Object.defineProperty(window, 'localStorage', {value: mock()});
Object.defineProperty(window, 'sessionStorage', {value: mock()});
Object.defineProperty(document, 'doctype', {
  value: '<!DOCTYPE html>'
});
//...
```

Demo

1-6-6

Jest

Before (Jasmine):

```
jasmine.createSpy('blah')
`spyOn(something, 'blah')
.and.returnValue()
.and.callFake(()=>{})
jasmine.createSpyObj('blah', ['prop']) blah = {prop: jest.fn()}
jasmine.any
jasmine.objectContaining
spy.calls.mostRecent().args[1]
```

After (Jest):

```
jest.fn()
jest.spyOn(something, 'blah')*
.mockReturnValue()
.mockImplementation(()=>{})
expect.any
expect.objectContaining
spy.mock.calls[spy.mock.calls.length - 1][1]
```

1-6-7

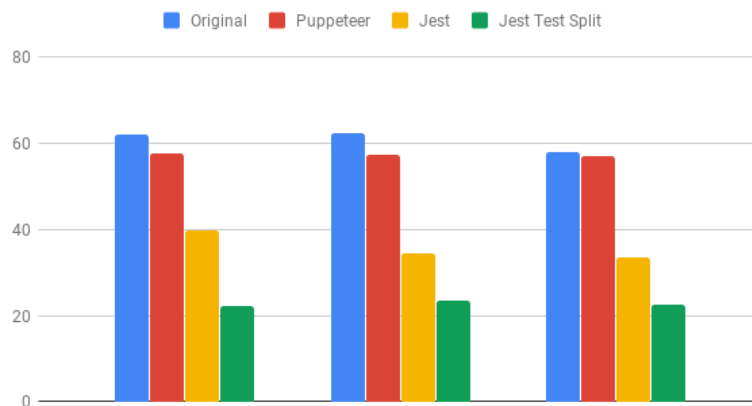

Traps

1-6-8

- `jest.spyOn()` doesn't replace function
- Differences in mock call accessing
- js-dom scroll support
- js-dom custom element support
- Replacing spy(s) in jest does not reset them

Mac 8 Cores

1-6-9

Disadvantages

1-6-10

- Harder to find examples
- May need to extend jsdom
- No one will visit your page with jsdom

1-6-11
